## Suggestions for Laboratories

### MDRD EQUATION

In adults, the best equation for estimating glomerular filtration rate (GFR) from serum creatinine is the MDRD equation.<sup>1,2</sup>

$$\text{GFR (ml/min/1.73 m}^2\text{)} = 186 \times (\text{P}_{\text{Cr}})^{-1.154} \times (\text{Age})^{-0.203} \times (0.742 \text{ if female}) \times (1.210 \text{ if African American})$$

The equation requires 4 variables:

- Serum creatinine
- Age
- Sex
- African American or not

Since a patient's race is often not available to clinical laboratories, a good alternative is to report estimated GFR values for both African Americans and non-African Americans (see Sample Reports below). Note that the equation does not require weight because the result is reported normalized to 1.73 m<sup>2</sup> body surface area, which is an accepted average adult surface area. If your printing system does not allow for superscripts, we recommend reporting ml/min/1.73 square meters.

### REPORTING VALUES

We presently recommend reporting values above 60 ml/min/1.73 m<sup>2</sup> merely as “above 60 ml/min/1.73 m<sup>2</sup>” not as an exact number such as 92 ml/min/1.73 m<sup>2</sup>. For values below 60 ml/min/1.73 m<sup>2</sup>, the report should give the numerical estimate such as “32 ml/min/1.73 m<sup>2</sup>” (see Sample Reports below).

#### There are 3 reasons for this recommendation:

1. The equation has been most extensively evaluated in people with some degree of renal insufficiency.
2. Inter-laboratory differences in calibration of the creatinine assay have their greatest impact in the near normal range and therefore lead to greater inaccuracies.<sup>3</sup>
3. Quantification of GFR below 60 ml/min/1.73 m<sup>2</sup> has more clinical implications than above that level.

### SAMPLE REPORTS

#### Sample report for a 55-year old man

Creatinine = 1.1 mg/dl

Glomerular filtration rate (GFR) estimate greater than 60 ml/min/1.73 m<sup>2</sup>

Average GFR for 50-59 years old = 93 ml/min/1.73 m<sup>2</sup>

Chronic Kidney Disease less than 60 ml/min/1.73 m<sup>2</sup>

Kidney failure less than 15 ml/min/1.73 m<sup>2</sup>

#### Sample report for 63-year old woman

Creatinine = 1.8 mg/dl

Glomerular filtration rate (GFR) estimate = 30 ml/min/1.73 m<sup>2</sup> if non-African American

Glomerular filtration rate (GFR) estimate = 37 ml/min/1.73 m<sup>2</sup> if African American

Average GFR for 60-69 years old = 85 ml/min/1.73 m<sup>2</sup>

Chronic Kidney Disease less than 60 ml/min/1.73 m<sup>2</sup>

Kidney failure less than 15 ml/min/1.73 m<sup>2</sup>

(over)

### Sample report for 62-year old man

Creatinine = 1.4 mg/dl

Glomerular filtration rate (GFR) estimate = 55 ml/min/1.73 m<sup>2</sup> if non-African American

Glomerular filtration rate (GFR) estimate greater than 60 ml/min/1.73 m<sup>2</sup> if African American

Average GFR for 60-69 years old = 85 ml/min/1.73 m<sup>2</sup>

Chronic Kidney Disease less than 60 ml/min/1.73 m<sup>2</sup>

Kidney failure less than 15 ml/min/1.73 m<sup>2</sup>

### REFERENCE TABLE FOR POPULATION MEAN GFRs FROM NHANES III<sup>4</sup>

AGE (years)	AVERAGE GFR
20-29	116 ml/min/1.73 m <sup>2</sup>
30-39	107 ml/min/1.73 m <sup>2</sup>
40-49	99 ml/min/1.73 m <sup>2</sup>
50-59	93 ml/min/1.73 m <sup>2</sup>
60-69	85 ml/min/1.73 m <sup>2</sup>
70+	75 ml/min/1.73 m <sup>2</sup>

### THE FUTURE

This approach provides the best means currently available of providing more accurate interpretation of the serum creatinine as renal function (GFR) and even appears better than 24-hour urine collections. However, efforts are underway to validate the equation in more diverse populations including Hispanics, people with diabetes, and people with normal renal function.

The inter-laboratory variation in the creatinine assay's calibration is being addressed by a Laboratory Working Group of the NKDEP ([www.nkdep.nih.gov](http://www.nkdep.nih.gov)).<sup>5</sup> The Laboratory Working Group is developing a program to standardize and improve serum creatinine measurements that will allow for accurate estimations of GFR in the range greater than 60 ml/min/1.73 m<sup>2</sup> and in children by all clinical laboratories.
